

News Release

EMBARGOED UNTIL RELEASE AT 8:30 A.M. EDT, THURSDAY, JUNE 24, 2021

BEA 21-29

Technical: Lisa Mataloni (GDP) (301) 278-9083 gdpniwd@bea.gov
 Kate Pinard (Corporate Profits) (301) 278-9417 cpniwd@bea.gov
 Media: Jeannine Aversa (301) 278-9003 Jeannine.Aversa@bea.gov

Gross Domestic Product (Third Estimate), Corporate Profits (Revised Estimate), and GDP by Industry, First Quarter 2021

Real gross domestic product (GDP) increased at an annual rate of 6.4 percent in the first quarter of 2021 (table 1), according to the "third" estimate released by the Bureau of Economic Analysis. In the fourth quarter, real GDP increased 4.3 percent.

The "third" estimate of GDP released today is based on more complete source data than were available for the "second" estimate issued last month. In the second estimate, the increase in real GDP was also 6.4 percent. Upward revisions to nonresidential fixed investment, private inventory investment, and exports were offset by an upward revision to imports, which are a subtraction in the calculation of GDP (see "Updates to GDP").

The increase in **real GDP** in the first quarter reflected increases in personal consumption expenditures (PCE), nonresidential fixed investment, federal government spending, residential fixed investment, and state and local government spending that were partly offset by decreases in private inventory investment and exports. Imports increased (table 2).

COVID-19 Impact on the First-Quarter 2021 GDP Estimate

The increase in first quarter GDP reflected the continued economic recovery, reopening of establishments, and continued government response related to the COVID-19 pandemic. In the first quarter, government assistance payments, such as direct economic impact payments, expanded unemployment benefits, and Paycheck Protection Program loans, were distributed to households and businesses through the Coronavirus Response and Relief Supplemental Appropriations Act and the American Rescue Plan Act. The full economic effects of the COVID-19 pandemic cannot be quantified in the GDP estimate for the first quarter of 2021 because the impacts are generally embedded in source data and cannot be separately identified. For more information, see the [Technical Note](#) and [Federal Recovery Program and BEA Statistics](#).

The increase in PCE reflected increases in durable goods (led by motor vehicles and parts), nondurable goods (led by food and beverages), and services (led by food services and accommodations). The increase in nonresidential fixed investment reflected increases in equipment (led by information processing equipment) and intellectual property products (led by software). The increase in federal government spending primarily reflected an increase in payments made to banks for processing and administering the Paycheck Protection Program loan applications as well as purchases of COVID-19 vaccines for distribution to the public. The decrease in private inventory investment primarily reflected a decrease in retail trade inventories (mainly by motor vehicles and parts dealers).

Current-dollar GDP increased 11.0 percent at an annual rate, or \$566.8 billion, in the first quarter to a level of \$22.06 trillion. In the fourth quarter, GDP increased 6.3 percent, or \$324.4 billion (table 1 and table 3). More information on the source data that underlie the estimates is available in the [Key Source Data and Assumptions](#) file on BEA's website.

The **price index for gross domestic purchases** increased 4.0 percent in the first quarter, compared with an increase of 1.7 percent in the fourth quarter (table 4). **The PCE price index** increased 3.7 percent, compared with an increase of 1.5 percent. Excluding food and energy prices, the PCE price index increased 2.5 percent, compared with an increase of 1.3 percent.

Gross Domestic Income and Corporate Profits

Real gross domestic income (GDI) increased 7.6 percent in the first quarter, compared with an increase of 19.4 percent in the fourth quarter. The **average of real GDP and real GDI**, a supplemental measure of U.S. economic activity that equally weights GDP and GDI, increased 7.0 percent in the first quarter, compared with an increase of 11.6 percent in the fourth quarter (table 1).

Profits from current production (corporate profits with inventory valuation and capital consumption adjustments) increased \$55.2 billion in the first quarter, in contrast to a decrease of \$31.4 billion in the fourth quarter (table 10).

Profits of domestic financial corporations decreased \$6.4 billion in the first quarter, in contrast to an increase of \$17.5 billion in the fourth quarter. **Profits of domestic nonfinancial corporations** increased \$72.1 billion, in contrast to a decrease of \$48.2 billion. **Rest-of-the-world profits** decreased \$10.6 billion, compared with a decrease of \$0.7 billion. In the first quarter, receipts increased \$34.2 billion, and payments increased \$44.8 billion.

Updates to GDP

In the third estimate, the change in first-quarter real GDP was the same as in the second estimate. Upward revisions to nonresidential fixed investment, private inventory investment, exports, and PCE were offset by an upward revision to imports. For more information, see the [Technical Note](#). For information on updates to GDP, see the "Additional Information" section that follows.

	Advance Estimate	Second Estimate	Third Estimate
	(Percent change from preceding quarter)		
Real GDP	6.4	6.4	6.4
Current-dollar GDP	10.7	11.0	11.0
Real GDI	...	6.8	7.6
Average of Real GDP and Real GDI	...	6.6	7.0
Gross domestic purchases price index	3.8	3.9	4.0
PCE price index	3.5	3.7	3.7
PCE price index excluding food and energy	2.3	2.5	2.5

Real GDP by Industry

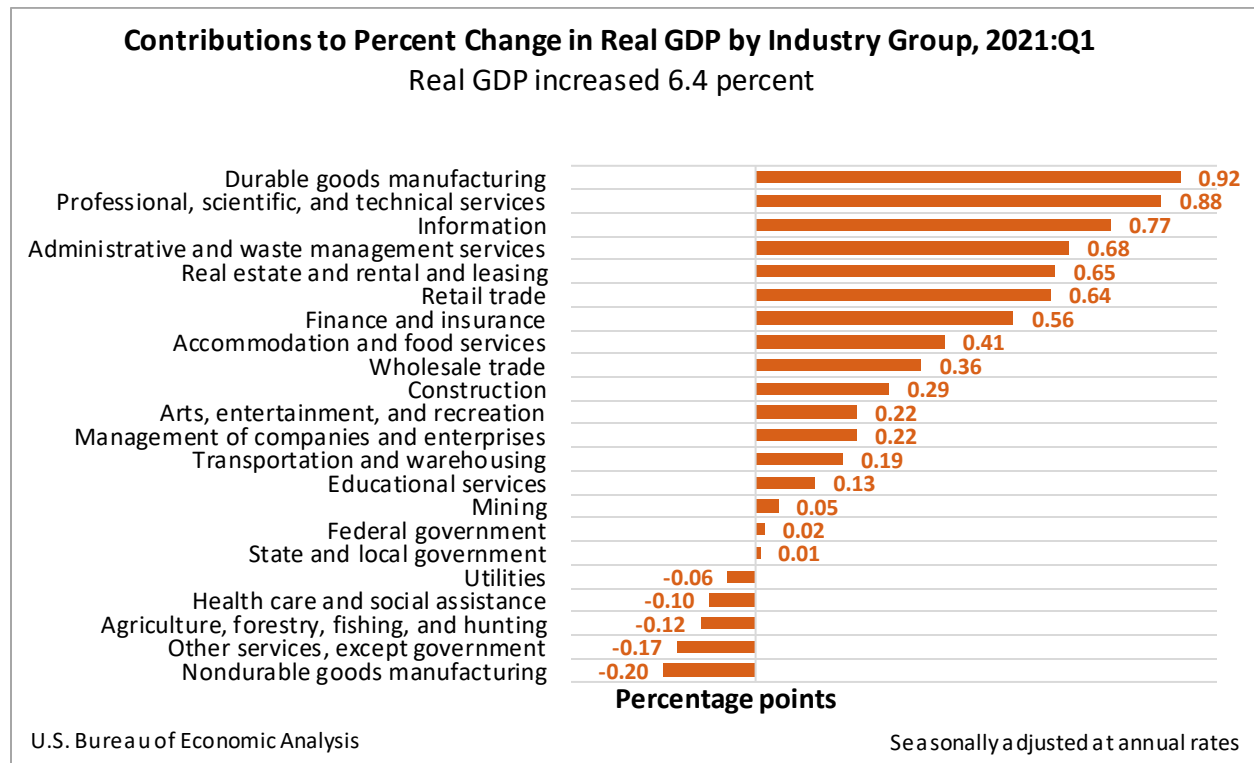

Today's release includes estimates of **GDP by industry**, or value added—a measure of an industry's contribution to GDP. In the first quarter, private goods-producing industries increased 5.4 percent, private services-producing industries increased 7.7 percent, and government increased 0.2 percent (table 12). Overall, 17 of 22 industry groups contributed to the first-quarter increase in real GDP.

The increase in private goods-producing industries primarily reflected an increase in durable goods manufacturing (led by computer and electronic products, fabricated metal products, and machinery). The increase was partly offset by decreases in nondurable goods manufacturing (led by petroleum and coal products) and agriculture, forestry, fishing, and hunting (led by farms).

The increase in private services-producing industries primarily reflected increases in professional, scientific, and technical services; information (led by data processing, internet publishing, and other information services); administrative and waste management services (led by administrative and support services); real estate and rental and leasing; and retail trade. These increases were partly offset by decreases in other services (which includes activities of political organizations); healthcare and social assistance (led by ambulatory health care services); and utilities.

The increase in government reflected increases in federal as well as state and local.

Gross Output by Industry

Real gross output—principally a measure of an industry’s sales or receipts, which includes sales to final users in the economy (GDP) and sales to other industries (intermediate inputs)—increased 8.9 percent in the first quarter (table 16). Private goods-producing industries decreased 1.7 percent, private services-producing industries increased 13.4 percent, and government increased 6.0 percent. Overall, 17 of 22 industry groups contributed to the increase in real gross output, led by retail trade, finance and insurance, and information. A decrease in nondurable goods manufacturing was the most notable offset to these increases.

Annual Update of the National Economic Accounts

BEA will release results from the 2021 annual update of the National Economic Accounts, which includes the National Income and Product Accounts (NIPAs) as well as the Industry Economic Accounts, later this year. Results from the annual update of the NIPAs will be released on July 29, 2021, along with the advance estimate of GDP for the second quarter of 2021. Results from the annual update of the Industry Economic Accounts will be released on September 30, 2021, along with the third estimate of GDP for the second quarter of 2021. The update of the National Economic Accounts will cover the first quarter of 1999 through the first quarter of 2021 and will result in revisions to GDP, GDP by Industry, and gross domestic income. For details, see [Information on the 2021 Annual Update of the National Economic Accounts](#).

Next release, July 29, 2021 at 8:30 A.M. EDT
Gross Domestic Product, Second Quarter 2021 (Advance Estimate) and Annual Update

Definitions

Gross domestic product (GDP), or **value added**, is the value of the goods and services produced by the nation's economy less the value of the goods and services used up in production. GDP is also equal to the sum of personal consumption expenditures, gross private domestic investment, net exports of goods and services, and government consumption expenditures and gross investment.

Gross domestic income (GDI) is the sum of incomes earned and costs incurred in the production of GDP. In national economic accounting, GDP and GDI are conceptually equal. In practice, GDP and GDI differ because they are constructed using largely independent source data.

Gross output is the value of the goods and services produced by the nation's economy. It is principally measured using industry sales or receipts, including sales to final users (GDP) and sales to other industries (intermediate inputs).

Current-dollar estimates are valued in the prices of the period when the transactions occurred—that is, at "market value." Also referred to as "nominal estimates" or as "current-price estimates."

Real values are inflation-adjusted estimates—that is, estimates that exclude the effects of price changes.

The **gross domestic purchases price index** measures the prices of final goods and services purchased by U.S. residents.

The **personal consumption expenditure price index** measures the prices paid for the goods and services purchased by, or on the behalf of, "persons."

Personal income is the income received by, or on behalf of, all persons from all sources: from participation as laborers in production, from owning a home or business, from the ownership of financial assets, and from government and business in the form of transfers. It includes income from domestic sources as well as the rest of world. It does not include realized or unrealized capital gains or losses.

Disposable personal income is the income available to persons for spending or saving. It is equal to personal income less personal current taxes.

Personal outlays is the sum of personal consumption expenditures, personal interest payments, and personal current transfer payments.

Personal saving is personal income less personal outlays and personal current taxes.

The **personal saving rate** is personal saving as a percentage of disposable personal income.

Profits from current production, referred to as corporate profits with inventory valuation adjustment (IVA) and capital consumption (CCAdj) adjustment in the National Income and Product Accounts (NIPAs), is a measure of the net income of corporations before deducting income taxes that is consistent with the value of goods and services measured in GDP. The IVA and CCAdj are adjustments that convert inventory withdrawals and depreciation of fixed assets reported on a tax-return, historical-cost basis to the current-cost economic measures used in the national income and product accounts. Profits for domestic industries reflect profits for all corporations located within the geographic borders of the United States. The rest-of-the-world (ROW) component of profits is measured as the difference between profits received from ROW and profits paid to ROW.

For more definitions, see the [Glossary: National Income and Product Accounts](#).

Statistical conventions

Annual-vs-quarterly rates. Quarterly seasonally adjusted values are expressed at annual rates, unless otherwise specified. This convention is used for BEA's featured, seasonally adjusted measures to facilitate comparisons with related and historical data. For details, see the FAQ "[Why does BEA publish estimates at annual rates?](#)"

Quarterly not seasonally adjusted values are expressed only at quarterly rates.

Percent changes. Percent changes in quarterly seasonally adjusted series are displayed at annual rates, unless otherwise specified. For details, see the FAQ "[How is average annual growth calculated?](#)" and "[Why does BEA publish percent changes in quarterly series at annual rates?](#)" Percent changes in quarterly not seasonally adjusted values are calculated from the same quarter one year ago. All published percent changes are calculated from unrounded data.

Calendar years and quarters. Unless noted otherwise, annual and quarterly data are presented on a calendar basis.

Quantities and prices. Quantities, or "real" volume measures, and prices are expressed as index numbers with a specified reference year equal to 100 (currently 2012). Quantity and price indexes are calculated using a Fisher-chained weighted formula that incorporates weights from two adjacent periods (quarters for quarterly data and annuals for annual data). For details on the calculation of quantity and price indexes, see Chapter 4: Estimating Methods in the [NIPA Handbook](#).

Chained-dollar values are calculated by multiplying the quantity index by the current dollar value in the reference year (2012) and then dividing by 100. Percent changes calculated from real quantity indexes and chained-dollar levels are conceptually the same; any differences are due to rounding. Chained-dollar values are not additive because the relative weights for a given period differ from those of the reference year. In tables that display chained-dollar values, a "residual" line shows the difference between the sum of detailed chained-dollar series and its corresponding aggregate.

Updates to GDP

BEA releases three vintages of the current quarterly estimate for GDP. "Advance" estimates are released near the end of the first month following the end of the quarter and are based on source data that are incomplete or subject to further revision by the source agency. "Second" and "third" estimates are released near the end of the second and third months, respectively, and are based on more detailed and more comprehensive data as they become available.

The table below shows the average revisions to the quarterly percent changes in real GDP between different estimate vintages, without regard to sign.

Vintage	Average Revision Without Regard to Sign (percentage points, annual rates)
Advance to second	0.5
Advance to third	0.6
Second to third	0.3

Note - Based on estimates from 1993 through 2019. For more information on GDP updates, see [Revision Information](#) on the BEA website.

Annual and comprehensive updates are typically released in late July. Annual updates generally cover at least the 5 most recent calendar years (and their associated quarters) and incorporate newly available major annual source data as well as some changes in methods and definitions to improve the accounts. Comprehensive (or benchmark) updates are carried out at about 5-year intervals and incorporate major periodic source data, as well as major conceptual improvements.

Unlike GDP, advance current quarterly estimates of GDI and corporate profits are not released because data on domestic profits and on net interest of domestic industries are not available. For fourth quarter estimates, these data are not available until the third estimate.

GDP by industry and gross output estimates are released with the third estimate of GDP.

r Revised

1. Real gross domestic income is gross domestic income deflated by the implicit price deflator for gross domestic product.

Note. Users are cautioned that particularly for components that exhibit rapid change in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate series. For accurate estimates of the contributions to percent changes in real gross domestic product, use table 2.

r Revised

1. Real gross domestic income is gross domestic income deflated by the implicit price deflator for gross domestic product.

Note. Users are cautioned that particularly for components that exhibit rapid change in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate series. For accurate estimates of the contributions to percent changes in real gross domestic product, use table 2.

r Revised

1. Food excludes personal consumption expenditures for purchased meals and beverages, which are classified in food services.

2. This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households.

1. Gross domestic income deflated by the implicit price deflator for gross domestic product.

2. Food excludes personal consumption expenditures for purchased meals and beverages, which are classified in food services.

3. This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households.

Note. Estimates under the *Percent change from the preceding year* columns are calculated from annual data. Estimates under the *Percent change from fourth quarter to fourth quarter* columns are calculated from fourth quarter values relative to the same quarter one year prior.

r Revised

1. Personal income is also equal to national income less corporate profits with inventory valuation and capital consumption adjustments, taxes on production and imports less subsidies, contributions for government social insurance, net interest and miscellaneous payments, business current transfer payments (net), and current surplus of government enterprises, plus personal income receipts on assets, and personal current transfer receipts.

2. The current-dollar measure is deflated by the implicit price deflator for personal consumption expenditures.

r Revised

1. The current-dollar gross value added is deflated using the gross value added chain-type price index for nonfinancial industries from the GDP-by-industry accounts. For periods when this price index is not available, the chain-type price index for GDP goods and structures is used.

2. Chained-dollar consumption of fixed capital of nonfinancial corporate business is calculated as the product of the chain-type quantity index and the 2012 current-dollar value of the corresponding series, divided by 100.

3. Chained-dollar net value added of nonfinancial corporate business is the difference between the gross value added and the consumption of fixed capital.

4. The deflator for gross value added of nonfinancial corporate business divided by 100.

Note. Estimates in this table are based on the 2012 North American Industry Classification System (NAICS).

1. Consists of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.

2. Consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance, insurance, real estate, rental, and leasing; professional and business services; educational services, health care, and social assistance; arts, entertainment, recreation, accommodation, and food services; and other services, except government.

Note. Percentage-point contributions do not sum to the percent change in real gross domestic product because the industry details are calculated using source data and methodologies that differ from those used to calculate growth in the top-line, expenditure-based measure of real GDP.
