EMBARGOED UNTIL RELEASE AT 8:30 A.M. EDT, THURSDAY, MARCH 30, 2017

BEA 17-14

Technical:	Lisa Mataloni (GDP)	(301) 278-9083	<a href="mailto:gdpniwd@bea.gov">gdpniwd@bea.gov</a>
	Kate Pinard (Corporate Profits)	(301) 278-9417	<a href="mailto:cpniwd@bea.gov">cpniwd@bea.gov</a>
Media:	Jeannine Aversa	(301) 278-9003	<a href="mailto:Jeannine.Aversa@bea.gov">Jeannine.Aversa@bea.gov</a>

## Gross Domestic Product: Fourth Quarter and Annual 2016 (Third Estimate) Corporate Profits: Fourth Quarter and Annual 2016

**Real gross domestic product** (GDP) increased at an annual rate of 2.1 percent in the fourth quarter of 2016 (table 1), according to the "third" estimate released by the Bureau of Economic Analysis. In the third quarter of 2016, real GDP increased 3.5 percent.

The GDP estimate released today is based on more complete source data than were available for the "second" estimate issued last month. In the second estimate, the increase in real GDP was 1.9 percent. With this third estimate for the fourth quarter, the general picture of economic growth remains largely the same; personal consumption expenditures (PCE) increased more than previously estimated (see "Updates to GDP" on page 2).

**Real gross domestic income** (GDI) increased 1.0 percent in the fourth quarter, compared with an increase of 5.0 percent in the third. The **average of real GDP and real GDI**, a supplemental measure of U.S. economic activity that equally weights GDP and GDI, increased 1.5 percent in the fourth quarter, compared with an increase of 4.3 percent in the third quarter (table 1).

The increase in real GDP in the fourth quarter reflected positive contributions from PCE, private inventory investment, residential fixed investment, nonresidential fixed investment, and state and local government spending that were partly offset by negative contributions from exports and federal government spending. Imports, which are a subtraction in the calculation of GDP, increased (table 2).

The deceleration in real GDP in the fourth quarter reflected downturns in exports and in federal government spending, an acceleration in imports, and a deceleration in nonresidential fixed investment that were partly offset by accelerations in private inventory investment and in PCE, and upturns in residential fixed investment and in state and local government spending.

**Current-dollar GDP** increased 4.2 percent, or \$194.1 billion, in the fourth quarter to a level of \$18,869.4 billion. In the third quarter, current-dollar GDP increased 5.0 percent, or \$225.2 billion (table 1 and table 3).

The **price index for gross domestic purchases** increased 2.0 percent in the fourth quarter, compared with an increase of 1.5 percent in the third quarter (table 4). **The PCE price index** increased 2.0 percent, compared with an increase of 1.5 percent. Excluding food and energy prices, the PCE price index increased 1.3 percent, compared with an increase of 1.7 percent (appendix table A).

### Updates to GDP

The upward revision to the percent change in real GDP primarily reflected upward revisions to PCE and to private inventory investment that were partly offset by downward revisions to nonresidential fixed investment and to exports. Imports, which are a subtraction in the calculation of GDP, were revised upward. For more information, see the [Technical Note](#). For information on updates to GDP, see the "Additional Information" section that follows.

	<u>Advance Estimate</u>	<u>Second Estimate</u>	<u>Third Estimate</u>
	(Percent change from preceding quarter)		
Real GDP	1.9	1.9	2.1
Current-dollar GDP	4.0	3.9	4.2
Real GDI	...	...	1.0
Average of Real GDP and Real GDI	...	...	1.5
Gross domestic purchases price index	2.0	1.9	2.0
PCE price index	2.2	1.9	2.0

### 2016 GDP

Real GDP increased 1.6 percent in 2016 (that is, from the 2015 annual level to the 2016 annual level), compared with an increase of 2.6 percent in 2015 (table 1).

The increase in real GDP in 2016 reflected positive contributions from PCE, residential fixed investment, state and local government spending, exports, and federal government spending that were partly offset

by negative contributions from private inventory investment and nonresidential fixed investment. Imports, which are a subtraction in the calculation of GDP, increased (table 2).

The deceleration in real GDP from 2015 to 2016 reflected downturns in private inventory investment and in nonresidential fixed investment and decelerations in PCE, in residential fixed investment, and in state and local government spending that were partly offset by a deceleration in imports and accelerations in federal government spending and in exports.

Current-dollar GDP increased 3.0 percent, or \$532.5 billion, in 2016 to a level of \$18,569.1 billion, compared with an increase of 3.7 percent, or \$643.5 billion, in 2015 (table 1 and table 3).

Real GDI increased 1.6 percent in 2016, compared with an increase of 2.5 percent in 2015 (table 1).

The price index for gross domestic purchases increased 1.0 percent in 2016, compared with an increase of 0.4 percent in 2015 (table 4).

During 2016 (that is, measured from the fourth quarter of 2015 to the fourth quarter of 2016), real GDP increased 2.0 percent, compared with an increase of 1.9 percent during 2015. The price index for gross domestic purchases increased 1.5 percent during 2016, compared with an increase of 0.4 percent during 2015. Real GDI increased 1.9 percent during 2016, compared with an increase of 1.5 percent during 2015 (table 7).

### **Corporate Profits (table 12)**

**Profits from current production** (corporate profits with inventory valuation adjustment and capital consumption adjustment) increased \$11.2 billion in the fourth quarter of 2016, compared with an increase of \$117.8 billion in the third quarter.

**Profits of domestic financial corporations** increased \$26.5 billion in the fourth quarter, compared with an increase of \$50.1 billion in the third. **Profits of domestic nonfinancial corporations** decreased \$60.4 billion, in contrast to an increase of \$66.4 billion. The estimate of nonfinancial corporate profits in the fourth quarter was reduced by a \$4.95 billion (\$19.8 billion at an annual rate) settlement between a U.S. subsidiary of Volkswagen and the federal and state governments. For more information, see the FAQ, "[What are the effects of the Volkswagen buyback deal on GDP and the national accounts?](#)" **The rest-of-the-world component of profits** increased \$45.1 billion, compared with an increase of \$1.3 billion. This measure is calculated as the difference between receipts from the rest of the world and payments to the rest of the world. In the fourth quarter, receipts increased \$9.1 billion, and payments decreased \$36.0 billion.

**In 2016, profits from current production** decreased \$2.3 billion, compared with a decrease of \$64.0 billion in 2015. Profits of domestic financial corporations increased \$20.5 billion, compared with an increase of \$8.5 billion. Profits of domestic nonfinancial corporations decreased \$47.0 billion, compared with a decrease of \$47.3 billion. The rest-of-the-world component of profits increased \$24.3 billion, in contrast to a decrease of \$25.2 billion.

### Definitions

**Gross domestic product** (GDP) is the value of the goods and services produced by the nation's economy less the value of the goods and services used up in production. GDP is also equal to the sum of personal consumption expenditures, gross private domestic investment, net exports of goods and services, and government consumption expenditures and gross investment.

**Gross domestic income** (GDI) is the sum of incomes earned and costs incurred in the production of GDP. In national economic accounting, GDP and GDI are conceptually equal. In practice, GDP and GDI differ because they are constructed using largely independent source data. Real GDI is calculated by deflating gross domestic income using the GDP price index as the deflator, and is therefore conceptually equivalent to real GDP.

**Current-dollar estimates** are valued in the prices of the period when the transactions occurred—that is, at "market value." Also referred to as "nominal estimates" or as "current-price estimates."

**Real values** are inflation-adjusted estimates—that is, estimates that exclude the effects of price changes.

The **gross domestic purchases price index** measures the prices of final goods and services purchased by U.S. residents.

The **personal consumption expenditure price index** measures the prices paid for the goods and services purchased by, or on the behalf of, "persons."

**Profits from current production**, referred to as corporate profits with inventory valuation adjustment (IVA) and capital consumption adjustment (CCAdj) in the NIPAs, is a measure of the net income of corporations before deducting income taxes that is consistent with the value of goods and services measured in GDP. The IVA and CCAdj are adjustments that convert inventory withdrawals and depreciation of fixed assets reported on a tax-return, historical-cost basis to the current-cost economic measures used in the national income and product accounts.

For more definitions, see the [Glossary: National Income and Product Accounts](#).

### Statistical conventions

**Annual rates.** Quarterly values are expressed at seasonally-adjusted annual rates (SAAR), unless otherwise specified. Dollar changes are calculated as the difference between these SAAR values. For detail, see the FAQ "[Why does BEA publish estimates at annual rates?](#)"

**Percent changes** in quarterly series are calculated from unrounded data and are displayed at annual rates, unless otherwise specified. For details, see the FAQ "[How is average annual growth calculated?](#)"

**Quantities and prices.** Quantities, or "real" volume measures, and prices are expressed as index numbers with a specified reference year equal to 100 (currently 2009). Quantity and price indexes are calculated using a Fisher-chained weighted formula that incorporates weights from two adjacent periods (quarters for quarterly data and annuals for annual data). "Real" dollar series are calculated by multiplying the published quantity index by the current dollar value in the reference year (2009) and then dividing by 100. Percent changes calculated from real quantity indexes and chained-dollar levels are conceptually the same; any differences are due to rounding.

**Chained-dollar values** are not additive because the relative weights for a given period differ from those of the reference year. In tables that display chained-dollar values, a "residual" line shows the difference between the sum of detailed chained-dollar series and its corresponding aggregate.

## Updates to GDP

BEA releases three vintages of the current quarterly estimate for GDP: "Advance" estimates are released near the end of the first month following the end of the quarter and are based on source data that are incomplete or subject to further revision by the source agency; "second" and "third" estimates are released near the end of the second and third months, respectively, and are based on more detailed and more comprehensive data as they become available.

Annual and comprehensive updates are typically released in late July. Annual updates generally cover at least the 3 most recent calendar years (and their associated quarters) and incorporate newly available major annual source data as well as some changes in methods and definitions to improve the accounts. Comprehensive (or benchmark) updates are carried out at about 5-year intervals and incorporate major periodic source data, as well as major conceptual improvements.

The table below shows the average revisions to the quarterly percent changes in real GDP between different estimate vintages, without regard to sign.

Vintage	Average Revision Without Regard to Sign (percentage points, annual rates)
Advance to second	0.5
Advance to third	0.6
Second to third	0.2
Advance to latest	1.1
Note - Based on estimates from 1993 through 2015. For more information on GDP updates, see <a href="#">Revision Information</a> on the BEA Web site.	

The larger average revision from the advance to the latest estimate reflects the fact that periodic comprehensive updates include major statistical and methodological improvements.

Unlike GDP, an advance current quarterly estimate of GDI is not released because data on domestic profits and on net interest of domestic industries are not available. For fourth quarter estimates, these data are not available until the third estimate.

<sup>r</sup> Revised  
<sup>1</sup> Real gross domestic income is gross domestic income deflated by the implicit price deflator for gross domestic product.  
NOTE: Users are cautioned that particularly for components that exhibit rapid change in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate series. For accurate estimates of the contributions to percent changes in real gross domestic product, use table 2.  
See *Explanatory Note* at the end of the tables.

<sup>r</sup> Revised

1. Food excludes personal consumption expenditures for purchased meals and beverages, which are classified in food services.

2. This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households. Percentage changes for these series are included in the addenda to table 8 and appendix table A.

See *Explanatory Note* at the end of the tables.

<sup>r</sup> Revised

1. Gross domestic income deflated by the implicit price deflator for gross domestic product.

2. Food excludes personal consumption expenditures for purchased meals and beverages, which are classified in food services.

3. This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households.

NOTE: Estimates under the *Percent change from the preceding year* columns are calculated from annual data. Estimates under the *Percent change fourth quarter to fourth quarter* columns are calculated from fourth quarter values relative to the same quarter one year prior.

See *Explanatory Note* at the end of the tables.

<sup>r</sup> Revised

1. Personal income is also equal to national income less corporate profits with inventory valuation and capital consumption adjustments, taxes on production and imports less subsidies, contributions for government social insurance, net interest and miscellaneous payments, business current transfer payments (net), and current surplus of government enterprises, plus personal income receipts on assets, and personal current transfer receipts.

2. The current-dollar measure is deflated by the implicit price deflator for personal consumption expenditures.

<sup>r</sup> Revised

1. The current-dollar gross value added is deflated using the gross value added chain-type price index for nonfinancial industries from the GDP-by-industry accounts. For periods when this price index is not available, the chain-type price index for GDP goods and structures is used. Effective with this release, the estimates of real gross value added of nonfinancial corporate business were revised historically, reflecting the incorporation of updated price deflators from BEA's industry economic accounts.

2. Chained-dollar consumption of fixed capital of nonfinancial corporate business is calculated as the product of the chain-type quantity index and the 2009 current-dollar value of the corresponding series, divided by 100.

3. Chained-dollar net value added of nonfinancial corporate business is the difference between the gross value added and the consumption of fixed capital. Effective with this release, the estimates of real gross value added of nonfinancial corporate business were revised historically, reflecting the incorporation of updated price deflators from BEA's industry economic accounts.

4. The deflator for gross value added of nonfinancial corporate business divided by 100.

NOTE. Estimates in this table are based on the 2002 North American Industry Classification System (NAICS).

<sup>r</sup> Revised  
1. For some components of final sales of computers, includes computer parts.  
2. Farm output less intermediate goods and services purchased.  
3. Consists of GDP less gross value added of farm, of households and institutions, and of general government.  
4. Food excludes personal consumption expenditures for purchased meals and beverages, which are classified in food services.  
5. This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households.  
See *Explanatory Note* at the end of the tables.

## Explanatory Note: NIPA Measures of Quantities and Prices

Current-dollar GDP is a measure of the market value of goods, services, and structures produced in the economy in a particular period. Changes in current-dollar GDP can be decomposed into quantity and price components. Quantities, or "real" measures, and prices are expressed as index numbers with the reference year -- at present, the year 2009 -- equal to 100.

Annual changes in quantities and prices are calculated using a Fisher formula that incorporates weights from two adjacent years. (Quarterly changes in quantities and prices are calculated using a Fisher formula that incorporates weights from two adjacent quarters; quarterly indexes are adjusted for consistency to the annual indexes before percent changes are calculated.) For example, the 2008-09 annual percent change in real GDP uses prices for 2008 and 2009 as weights, and the 2008-09 annual percent change in GDP prices uses quantities for 2008 and 2009 as weights. These annual changes are "chained" (multiplied) together to form time series of quantity and price indexes. Percent changes in Fisher indexes are not affected by the choice of reference year. (BEA also publishes a measure of the price level known as the implicit price deflator (IPD), which is calculated as the ratio of the current-dollar value to the corresponding chained-dollar value, multiplied by 100. The values of the IPD are very close to the values of the corresponding "chain-type" price index.)

Index numbers of quantity and price indexes for GDP and its major components are presented in this release in tables 5 and 6. Percent changes from the preceding period are presented in tables 1, 4, 7, 8, and appendix table A. Contributions by major components to the percent change in real GDP are presented in table 2.

Measures of real GDP and its major components are also presented in dollar-denominated form, designated "chained (2009) dollar estimates." For most series, these estimates, which are presented in table 3, are computed by multiplying the current-dollar value in 2009 by a corresponding quantity index number and then dividing by 100. For example, if a current-dollar GDP component equaled \$100 in 2009 and if real output for this component increased 10 percent in 2010, then the chained (2009) dollar value of this component in 2010 would be \$110 (= \$100 x 110 / 100). Percent changes calculated from chained-dollar estimates and from chain-type quantity indexes are the same; any differences will be small and due to rounding.

Chained-dollar values for the detailed GDP components will not necessarily sum to the chained-dollar estimate of GDP (or to any intermediate aggregate). This is because the relative prices used as weights for any period other than the reference year differ from those of the reference year. A measure of the extent of such differences is provided by a "residual" line, which indicates the difference between GDP (or other major aggregate) and the sum of the most detailed components in the table. For periods close to the reference year, when there usually has not been much change in the relative prices that are used as weights, the residuals tend to be small, and the chained-dollar estimates can be used to approximate the contributions to growth and to aggregate the detailed estimates. For periods further from the reference year, the residuals tend to be larger, and the chained-dollar estimates are less useful for analyses of contributions to growth. Thus, the contributions to percent change shown in table 2 provide a better measure of the composition of GDP growth. In particular, for components for which relative prices are changing rapidly, calculation of contributions using chained-dollar estimates may be misleading even just a few years from the reference year.
